

Advantages and disadvantages of BiDi optical modules

Overview

Cost Efficiency: Reduces fiber strand usage by half. This article will explain the BiDi optical transceiver, analyze its advantages and disadvantages, discuss applicable application scenarios, and introduce the various common types of BiDi transceivers. What is a BiDi Transceiver?

BiDi transceiver, or Bidirectional or simplex. A BiDi SFP module is a bidirectional fiber optic transceiver that enables simultaneous transmit and receive over a single strand of single-mode fiber, instead of the traditional two-fiber setup. This technique is especially valuable in fiber optic communications, as it effectively doubles the capacity of existing fiber infrastructure without. BiDi optical modules can do this by utilizing full-duplex communication over a single fiber strand via two wavelengths. In practical terms it lets one fiber carry both directions of traffic.
