

Digital data on the optical module

Overview

DDM, or digital diagnostic monitoring, is a technology used in SFP optical modules to enable users to monitor real-time parameters of SFPs. These parameters include optical output power, optical input power, temperature, laser bias current and transceiver power supply voltage. An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
