

Fusion splicing of different fiber optic patch panels

Overview

Fusion splicing involves strongly heating the two fiber endfaces until the material becomes soft and then joining them so that they fuse together. This process results in a permanent splice, often with very low insertion loss. Either joining method must have three primary characteristics. This guide reveals the secrets to fusion splicing with little fluff—just proven, straightforward techniques refined from years of work in the field. The guide provides the complete workflow, covering safety precautions, tool selection, fiber preparation, fusion operation, quality control, and. Fiber splicing means joining two optical fibers (permanently or temporarily) such that light guided in one fiber and reaching the joint (splice) can be transferred into the second fiber with low insertion loss. For network managers and technicians, a poor splice can lead to significant signal degradation, network downtime, and costly troubleshooting. What is Fiber Optic Splicing and Why is it Needed?
