

# How to identify an aggregation switch

## Overview

An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. An Aggregation or "Top-of-Rack" switch is designed to connect everything in a rack at high speeds, then have an even bigger pipe out to the rest of the network. The Pro Aggregation does this with its SFP28 25Gbps ports. It is essential for larger networks requiring efficient data flow. These factors may include but are not limited to speed, features, and price. However, in today's highly competitive distribution Layer layer switch market, switches differ in small. Switch aggregation, also known as link aggregation or trunking, is a method used in computer networking to combine (aggregate) multiple network connections in parallel.
