

Inspection cycle of relay protection devices

Overview

Protective circuit functional testing, including lockout relay testing, must take place immediately upon installation, every 2 years thereafter, and upon any change in wiring. For the proper testing, we follow standard procedures like AS/NZS 60255 series for protection devices and electrical relays. (ii) On relay types which have been used earlier, only minimum necessary checks should. Abstract: This paper introduces the importance of comprehensive relay protection device, the key role it plays in the power system, the verification cycle and maintenance content of relay protection device, and improves the utilization efficiency of equipment and reduces the maintenance cost of. The first relays were Electromechanical (EM): machines with moving parts actuated by coils connected to current and voltage sources. These required regular testing, adjustments and maintenance to ensure continued functioning.
