

Oddy optical cable testing

Overview

The Oddy Test is an accelerated aging test that exposes silver, copper, and lead coupons to conservation materials at 60°C and approximately 100% relative humidity for 28 days (Figure 1). Neither AIC nor participating institutions endorse particular methods, products, businesses, or services. Institutional protocols are not vetted or peer-reviewed and should be assessed by each individual. The purpose of this study is to examine current versions of the Oddy test, to identify differences in the results derived from variations in the procedures, and ultimately raising awareness within the conservation community to work together towards a standardized protocol. Oddy testing is, by its nature, subjective. We have, therefore, requested Prof. Often, materials for construction and museum contexts (including artefact conservation) are evaluated for. Fiber optic testing ensures the performance and reliability of fiber optic networks.
