

Power value of optical power meter

Overview

It is an instrument specifically used for measuring the strength of optical signals. It converts optical signals into electrical signals through a photoelectric sensor and then displays the power value in units of decibels-milliwatts (dBm) or watts (W). Other general purpose light power measuring devices are usually called radiometers, photometers, laser power. What are Optical Power Meters?

An optical power meter (or laser powermeter) is an instrument for the measurement of the optical power (the delivered energy per unit time) in a light beam, for example a laser beam. Due to the micro-processor technology applied, this measuring instrument makes it possible to measure. These meters provide a precise and reliable method for quantifying the power level of light across various wavelengths, making them essential instruments in the testing and calibration of optical systems.
