Relay protection annual inspection cycle

Overview

A general rule of thumb would be to visually inspect every one to two years, secondary injection testing every one to three years, and primary injection every three to five years or on major changes. Primary injection testing takes it one step further by passing actual fault currents through the entire protection chain—current transformers, the relay. Electromechanical and microprocessor relays should receive a monthly visual inspection. Look over the relays and their cases for any physical damage, and check for foreign objects or debris. For microprocessor units, make sure the relay is displaying the correct date and time. Annual visual and. Acceptance tests are generally performed in the laboratory. ABB's knowledge and experience are not limited to relays only, full support for all protection and control relays throughout their entire life cycle.
