

Single-optical module transmission failed

Overview

The receive and transmit optical power of the optical module is not within the normal range. The self-loop of a single fiber cannot go up. If not, configure. Customers in the use of optical modules will more or less encounter a variety of failure problems, such as optical module model selection is correct, the use of jumper is correct and some common problems, customers have the ability to judge and have a clear solution, but for some of the use of. Based on typical issues encountered with optical modules in daily switch applications, this document summarizes basic troubleshooting steps for resolving common faults: 1. Therefore, understanding common optical module. Why is no connection established between the communication partners on an optical transmission path?

There can be various reasons if no connection is established between the communication partners even though there is an optical connection. It is important to understand how to.
