

Switch combines several optical fibers into one

Overview

A fiber-optic switch is a device used in fiber optics to route light from one or more input fibers to one or more output fibers. It can act as a simple on/off switch or a complex matrix switch with multiple inputs and outputs, such as 2x2 or even 64x64. The combiners below are offered in 2x1, 3x1, or 4x1 packages. Fiber combiners are integral in applications where high power. Light from an input fiber is first collimated, then sent through a beam-splitting optic to divide it into two. in optical fiber networks to selectively switch optical signals from one fiber to another Category: fiber optics and waveguides More general term: optical switches Related: optical switches fibers optical fiber communications Page views in 12 months: 695 DOI:. A fiber optic splitter is a passive device that divides an optical signal into multiple parts.
