

Universal use of optical transceivers and switches

Overview

These transceivers are widely used in networking equipment such as switches, routers, and servers, enabling seamless communication across vast distances with minimal data loss. No matter, which data rate, form factor or host system – they just work. And where Universal Transceivers are the mandatory base for optical networks, the unique FLEXBOX series. This paper first summarizes the topologies and traffic characteristics in data centers and analyzes the reasons and importance of moving to optical switching. Recent techniques related to the optical switching, and main challenges limiting the practical deployments of optical switches in data. Extreme Networks offers a complete set of high-performance, reliable, and cost-effective optical transceivers and cables to help enterprises and service providers meet the challenges of diverse network topologies. It converts electrical signals from networking devices into optical signals for transmission through fiber optic cables and then back into electrical signals upon reception. US data center internal switch interconnects are mainly single-mode fiber.
