

WDM wavelength division multiplexer composition

Overview

The basic composition of WDM systems mainly includes two types: dual-fiber unidirectional transmission and single-fiber bidirectional transmission. Unidirectional WDM involves all optical channels being transmitted in the same direction through a single optical fiber. This technique enables bidirectional communications over a. Wavelength division multiplexing (WDM) is a technology that combines two or more optical carrier signals of different wavelengths (carrying various information) at the transmitting end through a multiplexer (also called a combiner, Multiplexer) and couples them to the same optical fiber of the. Wavelength Division Multiplexing (WDM) is a technique in fiber-optic communication systems that enables multiple optical signals with different wavelengths to be combined, transmitted, and separated over a single optical fiber.
