

Wavelength Division Multiplexing 1800

Overview

The Loop-WDM1800 Wavelength Division Multiplexing Multi-Service Platform is designed to deliver a number of client data channels by multiplexing/demultiplexing several different wavelengths into/from an optical fiber. The WDM1800 platform provides up to 15 universal plug-in slots for mounting different. Corning's R&D scientists are constantly searching for new ways to improve wavelength division multiplexing (WDM) technology. Close collaboration with our customers and our proven expertise across fiber, cable, and connectivity ensure you'll get solutions that are smarter, denser, faster, and easier. The new OCM 1800 yellobrik can send or receive up to 18 individual signals over a single fiber link. It uses coarse wavelength division multiplexing (CWDM) to combine multiple signals onto one fiber and separate them back out at the other end, making more efficient use of existing infrastructure. This guide delves into the principles, types, applications, and future trends of WDM.

In fiber-optic communications, wavelength-division multiplexing (WDM) is a technology which multiplexes a number of optical carrier signals onto a single optical fiber by using different wavelengths (i.e., colors) of laser light. This technique enables bidirectional communications over a single strand of fiber (also called wavelength-division duplexing) as well as multiplication of capacity.
