

What is the minimum power rating of a photovoltaic combiner box

Overview

The standard rating is $I_n = 20 \text{ kA}$, $I_{max} = 40 \text{ kA}$, with a voltage protection level (U_p) below the system's maximum voltage. For a 1500 V combiner, look for $U_p \leq 4 \text{ kV}$. Optional but increasingly standard. A PV combiner box is an electrical distribution device used in utility-scale solar systems to combine multiple DC inputs from solar panel strings into a single output circuit. In large solar farms, dozens or even hundreds of strings are installed. Specification must account for cold temperature open-circuit voltage increases per NEC 690. 7 Calculation: Maximum system voltage = $V_{oc} \times \text{temperature}$. In this article, we walk you through a real-world case—144 solar panels of 555W each paired with a powerful 80kW inverter—and demonstrate exactly how to calculate your system's configuration. You'll learn how to match string configurations, assign MPPTs, and size your combiner box with confidence. Add string-level monitoring on every system above 500 kW. In this guide: For anyone tracking the 2026 NEC adoption cycle, here is the current status of every relevant section governing combiner boxes.
