

What is the normal current amperes for a relay protection device

Overview

The relay's current rating should be higher than this total to ensure safety. For example, if your system has a steady current of 5A and an inrush current of 10A, choose a relay rated for at least 12-15A. Relays are normally specified with separate AC and DC contact ratings. Three fundamental components required for each circuit breaker. CT's transform line current down to a signal level that is. In the design of electrical power systems, the ANSI Standard Device Numbers denote what features a protective device supports (such as a relay or circuit breaker). The selection and applications of protective relays and their associated schemes shall achieve reliability, security, speed and properly coordinated. Meanwhile. A relay rated to switch 10 amps of AC voltage may have a much lower amperage rating for DC voltage because DC arcs are more difficult to extinguish.
