

What is the normal power of an optical module

Overview

The average transmit power refers to the optical power output by the light source at the transmit end of the optical module under normal working conditions, which can be considered as the luminous intensity. These modules, including SFP, SFP+, and SFP28, are widely used in enterprise networks, data centers, and carrier-grade deployments. When designing optical networks, understanding the TX/RX power range is vital for ensuring optimal performance and long-term reliability. The transmitted optical power is related to the proportion of "1"s in the transmitted data signal; the more "1"s, the. In optical communication systems, the transmit power and receive power of an optical transceiver are among the key indicators used to evaluate link quality and module operating status. They play an important role during new link deployment, compatibility testing, and link troubleshooting. However, in practical use, we adopt the average Tx power.
